The Collaborative Clinical Research Program (CCRP) will provide structure and support for College of Veterinary Medicine faculty and collaborators involved in clinically-based research projects addressing a broad spectrum of issues that impact animal and human health and welfare. The CCRP recognizes the importance of building strong collaborations between scientists, clinicians, industry, government entities, special interest and philanthropic groups, and pet owners in order to achieve its research goals. Research areas of interests within the group include:
- Animal-human interactions
- Infectious diseases
- Orthopedics & biomechanics
- Preventive medicine
- Regenerative medicine
- Therapeutic interventions

The CCRP will strive to enhance and extend the body of evidence informing clinical understanding and decisions in veterinary medicine, public health, and other areas at the interface between animals and humans. A key function of the group will be to produce scholarly publications and other methods of disseminating information derived from our research. We welcome collaborators to help us find answers to important clinical problems and veterinary issues. Your contribution may be as small as a submitting a clinical specimen or as involved as participation in a clinical consortium.
