

Instructions on how to install the Pharos Popup Client:

The Pharos popup client is a one-time installation. It does not require you to have a webpage open while printing, nor does it require any specific software/updates be installed prior to its installation. It auto-detects which Windows operating system you have, so you do not need to worry about figuring out which version is the best for you. Mac users will click a separate link taking them to the Mac installer download. When installed, the Popup Client will install both the Color and Black & White printer queues and the drivers associated. It will also install a software updater that will check the system regularly for any updates to the printers as well as an uninstaller if you choose to remove the client at any time.

1. Open a web browser and navigate to <http://pharosprint.westernu.edu/uniprint>. (***Note* you will need to be connected on the Western University Wired or Wireless Network**)
2. Click the link named **"Packages"**
3. Click the link of your respective operating system **Mac** or **Windows**
4. Save the file to your desktop
5. Once downloaded, Double-click and install the client from wherever you saved it.
6. Select **"Install"** to begin the installation
7. Select **"Finish"**

You have successfully installed the student print queues on your local computer. From this point on, when printing, you may select printers **"WesternU B&W"** or **"WesternU Color"** accordingly, to send your jobs.
